HOG CHOLERA

OTTAWA, April 30, 1959.—About 296 hogs near St. John's Newfoundland, were ordered slaughtered after hog cholera was diagnosed in the herd, Dr. K. F. Wells, Veterinary Director General, announced today.

Cholera is a virus disease of feeding swine, resulting in high mortality.

The disease was believed to feed the pigs excreta collected from a nearby Ontario military air base, and officials believe the infection came from the garbage.

Precautionary measures were taken immediately and there is no evidence that the disease has spread.

Hog cholera in Canada was first reported in October, 1957, when it was confined to one small Ontario herd. The last serious outbreak, April 29, May 1, 2 and 3, 1958, was confined to Western Ontario in the fall of 1958.

The Newfoundland hog producer will be compensated to the market value of his swine. The premises have been cleaned and disinfected and will remain vacant for several weeks.

Local & District

Don Killian, of London, was a week and visitor with his parents, Mr. and Mrs. P. Killian.

Mr. and Mrs. Herman Jorgberg have arrived home from Vancouver, where they spent three months.

Harry Bullf (jun.) has purchased the Drumbeller Iron Works welding shop, situated on 5th Street West.

Mr. and Mrs. Dick Gordon and family, of Calgary, were visitors at the home of Mr. and Mrs. M. Williams, last Sunday.

Mr. and Mrs. H. McKay, of Melville, Sask., were visitors with Mr. and Mrs. E. Milne, for a couple of weeks.

If you are in the market for a good used low priced car or truck, guaranteed in perfect running order, see Larkin & Isaac. They will be pleased to talk to you about it.

Mild, dry weather prevails at this writing Tuesday afternoon. The snow is all gone. Skies have become overcast and threatening, with brisk winds. Temperature is 55 above.

THE IMPORTANCE OF SEED TREATMENT

In recent years, Science has shown to the farmer that in the treatment of seed, a fairly important list of seed treatment products which are now registered for use in Canada. Probably over half of these products are granular materials, commonly used for the effective treatment of such crops as wheat, oats and barley, and of seedling field and root seed to the case of these same crops and flax. Certain seed treatments are fungicide-insecticide, some of which give protection against wireworm damage, are also on the market.

All seed treatment products are classified as giving satisfactory control on all counts for all the crops listed. The performance of some of them will vary, to an extent, depending upon the type of disease and the kind of crop treated. It is important, therefore, to make sure that the product selected will be satisfactory for the purpose intended.

Unfortunately, despite steady progress in this field, a good deal of seed which finds its way into the ground each spring is still untreated. As the insects resulting from seed treatment are more fully realized and appreciated, it will no doubt become common practice to provide this form of protection for growing cereal crops, particularly since it can be had at a relatively low cost per bushel. In the meantime, there is no lack of products available for the purpose; and science is still at work.
